NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LV. BOSTON, MASS., JANUARY. 1943. No. 1.

GENERAL SUMMARY

The weather in New England during January, 1943 was typical of the mid-winter month in one of its most severe moods. While Arctic cold in its bitterest extremes did not occur, the long continued period of unrelenting cold during practically the first two weeks of the month, and the brief but more severe period with the advent of the 3d decade, accumulated such a surplus of cold that much suffering resulted. This was sharply accentuated by fuel shortages and other war-time restrictions, particularly in metropolitan districts. Snow was not of great importance during the month, until the 28th, when heavy falls were recorded in the southern division. Snow in the three northern States was sub-normal. In Massachussetts the snow averaged 2 feet, and at a few scattered stations approached 3 feet. Thus, with drastically restricted fuel oil rations and halting and uncertain transportation, the personal impression of the weather's severity was perhaps even greater than is shown by arithmetical statistics. These characteristics and impressions, taken into consideration with the adverse accumulations which December recorded, are establishing a winter of memorable severity from both personal and statistical viewpoints. And when January, usually the coldest month, is colder than normal, there is occasioned a heating deficit more difficult to equalize or overcome than in any other month.

TEMPERATURE

The average monthly temperature for the Section, based on 115 records, was 18.9°, which is 3.5° below the mean for the past 56 years. The average temperature for the northern division was 14.0°; for the southern division, 23.8°. The highest monthly mean was 29.4° at Nantucket, Mass. and Block Island, R. I.; the lowest was 4.3° at Caribou, Me. The highest recorded was 54° at Providence, R. I. on the 25th; the lowest was −34° at Fort Kent, Me. on the 22d. The greatest monthly range was 71° at Enosburg Falls, Vt. and Northfield, Vt.; the least was 37° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 2.47 inches, which is 0.97 inch below the mean for the past 56 years. The average precipitation for the northern division was 1.68 inches; for the southern division, 3.25 inches. The greatest monthly amount reported was 4.76 inches at Hyannis, Mass.; the least was 0.46 inch at Presque Isle, Me. The greatest amount in 24 hours was 2.38 inches at Marion, Conn. on the 28th. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 56 years.

The average snowfall for the northern division, based on 90 records, was 18.0 inches; for the southern division, based on 87 records, 22.5 inches; for the Section, based on 177 records, was 20.2 inches, which is 4.7 inches above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was northwest. The average velocity, based on the records at 16 stations, was 10.6 miles per hour, which is 0.4 mile per hour below the mean.

The sunshine, based on the records at 14 stations, averaged 50 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was at the mean. The average for the Section, based on 134 records, was 11 clear, 7 partly cloudy, and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

DATES OF MISCELLANEOUS PHENOMENA

Auroras.— 4-5th.

Halos, lunar.— 12-17th, 20-24th, 26th, 28th.

Halos, solar.— 10th, 14th, 21st, 23-25th, 27-28th.

Hail.—(dates and general location)— None.

Thunderstorms.— 18th, Block Island, R. I. and along Connecticut coast.

Fog, dense.— 8th, 11-12th, 15th, 18-19th, 23d, 25-26th, 31st.

Sleet.— (dates and general location)— General over Section: 18-19th; scattered or over limited areas (mostly in southern division), 1st, 4th, 14-17th, 23-26th, 28-31st.

Earthquake.— 14th, two shocks of slight intensity but more pronounced in northern division; first temblor at 5:33 p.m. (E.W.T.), second about 10 seconds later; epicenters somewhere north of Portland, Me.; no damage reported.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or "standard mean" adjusted to a uniform 35-year period; for stations of 10 to 14 years of record the means for the period of record are used. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for January, 1943

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LV. BOSTON, MASS., FEBRUARY, 1943. No. 2.

GENERAL SUMMARY

February in New England is normally a month of sharp temperature ranges and contrasts, but those recorded in this month of 1943 were of record-breaking proportions. The record at East Barnet, Vt., where a range of 101° occurred between the 16th and 23d, stands out as an indication of the intense contrasts experienced. This range at East Barnet is the greatest ever recorded at any New England station for such a short period of time, and is the greatest local range ever recorded in any month in New England. During the first 11 days, a considerable excess of warmth was accumulated, and the prospect seemed assuring for relief from the stringency in supply of heating fuels. But during the period from the 15th to the 17th a severe wave of Arctic cold overspread the Section bringing record low temperatures for so late in the season over much of the Section. Readings of 30° below zero or lower were recorded in each of the New England States, except Rhode Island, with results that seemed likely to extend far into the crop-growing season. From the 20th to the 24th temperatures reached into the upper 50's and lower 60's, approaching record highs for the time of year in some instances, equalizing and overcoming the accumulation of cold previously established. During this warm period, from 2 to 30 inches of snow was lost from the blanket which covered the Section. The remainder of the month brought less marked deviation from normal temperature. Numerical averages cannot reveal a proper representation of the month's weather, nor can they do full justice to the lasting personal impressions that this winter has been long and severely unpleasant and rigorously confining. The termination of the "meteorological winter" brought hopeful anticipation of more agreeable weather.

TEMPERATURE

The average monthly temperature for the Section, based on 110 records, was 24.1°, which is 1.4° above the mean for the past 56 years. The average temperature for the northern division was 20.5°; for the southern division, 27.7°. The highest monthly mean was 32.3° at Chestnut Hill, Mass.; the lowest was 13.0° at First Connecticut Lake, N. H. The highest recorded was 65° at Weston, Mass. on the 23d; the lowest was −46° at East Barnet, Vt. on the 16th. The greatest monthly range was 101° at East Barnet, Vt.; the least was 58° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 1.92 inches, which is 1.15 inches below the mean for the past 56 years. The average precipitation for the northern division was 2.15 inches; for the southern division, 1.70 inches. The greatest monthly amount reported was 4.17 inches at Rochester, Vt.; the least was 1.03 inches at Bethlehem, N. H. The greatest amount in 24 hours was 1.46 inches at Vanceboro, Me. on the 11th. The average number of days with .01 inch or more of precipitation was 10, which is 1 above the mean for the past 56 years.

The average snowfall for the northern division, based on 86 records, was 14.4 inches; for the southern division, based on 85 records, 5.9 inches; for the Section, based on 171 records, was 10.2 inches, which is 6.1 inches below the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 131 records, was northwest. The average velocity, based on the records at 16 stations, was 10.9 miles per hour, which is 0.6 mile per hour below the mean.

The sunshine, based on the records at 14 stations, averaged 56 percent of the possible amount, which is 5 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 132 records, was 10 clear, 7 partly cloudy, and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is 1 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

DATES OF MISCELLANEOUS PHENOMENA

Auroras.— 25th, 26th.

Halos, lunar.— 10th, 12th, 14th, 16-24th, 28th.

Halos, solar.—3d, 6th, 9th, 10th, 13th, 14th, 16-18th, 21-23d, 26th.

Hail.— (dates and general location)— None.

Thunderstorms.— 28th, Portland, Me. and vicinity.

Fog, dense.— 1st, 3-7th, 11th, 13th, 14th, 16th, 23d, 24th.

Sleet.— (dates and general location)—Reports of sleet occurrence in many portions of Section on the 1st, 4th, 6th, 7th, 10th, 11th, 13th, 14th, (latter two dates in southern division only). No sleet occurrences reported after 14th.

Lunar Eclipse.— Partial, began 9:43 p. m. on 19th, ended at 3:32 a. m. on 20th, (75th Meridian Time).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or "standard mean" adjusted to a uniform 35-year period; for stations of 10 to 14 years of record the means for the period of record are used. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H ; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for February, 1943

VOL. LV. BOSTON, MASS., MARCH, 1943. No. 3.

GENERAL SUMMARY

Beginning the second day of March, 1943, one of the longest cold periods for the season overspread the Section, as well as nearly all regions east of the Rocky Mountains. Temperatures on the 9th were down to 27° below zero in northern portions, and slightly sub-zero in nearly all of the southern portion of the area. At Lake Frontiere on the northwestern Maine boundary it was 40° below zero on that date. There were three periods with warmth above normal: about the 12th, 18th and 26th; but these were inadequate to counterbalance the severity of the earlier cold. The snow cover showed signs of disappearing over southernmost portions by the middle of the month, while at the same time, it was 6 1-2 feet deep at Fort Kent, Maine, and retreating slowly, was nearly all gone, except over extreme north portions, by the close of the month. The extreme cold and the tardy disappearance of the snow cover seriously delayed farmers' preparations for the crop-growing season. The upward march of temperature during the month was from an estimated 20° to slightly above freezing over the entire Section. The extreme cold day of the month, the 9th, was attendant upon an unusually high barometric pressure of several hundredths of an inch over 31 inches of mercury.

TEMPERATURE

The average monthly temperature for the Section, based on 110 records, was 30.4°, which is 1.7° below the mean for the past 56 years. The average temperature for the northern division was 26.9°; for the southern division, 34.0°. The highest monthly mean was 38.0° at Chestnut Hill, Mass.; the lowest was 15.6° at Lake Frontiere, Me. The highest recorded was 71° at Norwalk, Conn. on the 26th; the lowest was -40° at Lake Frontiere, Me. on the 9th. The greatest monthly range was 88° at Lake Frontiere, Me.; the least was 45° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 3.07 inches, which is 0.60 inch below the mean for the past 56 years. The average precipitation for the northern division was 2.60 inches; for the southern division, 3.54 inches. The greatest monthly amount reported was 5.72 inches at Machias, Me.; the least was 1.24 inches at Newport, Vt. The greatest amount in 24 hours was 2.94 inches at Mt. Carmel, Conn. on the 6-7th. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 56 years.

The average snowfall for the northern division, based on 89 records, was 14.8 inches; for the southern division, based on 80 records, 8.9 inches; for the Section, based on 169 records, 12.0 inches, which is 0.7 inch above the mean for the past 56 years.

ERRATUM: In Annual Climatologicl Report, 1942, p. 102, precipitation for Storrs, Connecticut in July should be 4.58.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was northwest. The average velocity, based on the records at 16 stations, was 10.8 miles per hour, which is 0.4 mile per hour below the mean.

The sunshine, based on the records at 14 stations, averaged 53 percent of the possible amount, which is 1 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 132 records, was 10 clear, 8 partly cloudy, and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 72 percent, which is 2 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or "standard mean" adjusted to a uniform 35-year period; for stations of 10 to 14 years of record the means for the period of record are used. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for March, 1943

VOL. LV. BOSTON, MASS.. APRIL, 1943. No. 4.

GENERAL SUMMARY

April, 1943 was the coldest April of record in the southern division since Section records were first compiled in 1888, and the coldest in the northern division except in 1926 when it was one degree colder. This cold was a deterring factor in the usual inauguration of spring activities, and was particularly a hindrance in agricultural preparations and early growth. Maple-sugar making was delayed to an unusually late date. The cold was an attendant factor in causing deeper snowfall than normal, and snowplows were required to clear drifted highways in the Berkshires and in many northern localities from the storm of the 13–14th. At several mountain stations and in parts of Maine the snow depth for the month exceeded 20 inches, and at Pinkham Notch, N. H., the fall of new snow totaled 40 inches. A severe thunderstorm was a feature of the storm of the 13-14th over eastern districts where little snow fell, and destructive lightning caused fire, death and other lesser damage. Winds also caused destruction in scattered localities, and a maximum velocity of 61 miles per hour was recorded at Caribou, Maine. The coldest period of the month was the 6–7th; and the warmest, from the 23d to the 26th. Lack of rain from the 3d to the 12th increased the forest fire hazard especially in southern localities and some fires occurred. At the month's close, vegetation and agricultural preparations appeared to be from ten days to two weeks late.

TEMPERATURE

The average monthly temperature for the Section, based on 107 records, was 38.6°, which is 5.0° below the mean for the past 56 years. The average temperature for the northern division was 36.3°; for the southern division, 41.1°. The highest monthly mean was 44.3° at Springfield, Mass.; the lowest was 27.8° at First Connecticut Lake, N. H. The highest recorded was 77° at Durham, N. H. on the 25th; the lowest was −5° at First Connecticut Lake, N. H. on the 4th, and at Ft. Kent, Me. on the 8th. The greatest monthly range was 73° at Ft. Kent, Me.; the least was 40° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 188 records, was 3.33 inches, which is the mean for the past 56 years. The average precipitation for the northern division was 3.19 inches; for the southern division, 3.47 inches. The greatest monthly amount reported was 5.12 inches at Somerset, Vt.; the least was 1.60 inches at Presque Isle, Me. The greatest amount in 24 hours was 1.54 inches at Pinkham Notch, N. H. on the 13–14th, and at Bennington, Vt. on the 19–20th. The average number of days with .01 inch or more of precipitation was 12, which is 2 above the mean for the past 56 years.

The average snowfall for the northern division, based on 84 records, was 11.0 inches; for the southern division, based on 86 records, 2.0 inches; for the Section, based on 170 records, 6.5 inches, which is 2.3 inches above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was northwest. The average velocity, based on the records at 16 stations, was 11.3 miles per hour, which is 0.4 mile per hour above the mean.

The sunshine, based on the records at 14 stations, averaged 54 percent of the possible amount, which is the mean.

Cloudiness was above the mean. The average for the Section, based on 132 records, was 9 clear, 8 partly cloudy, and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 70 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or "standard mean" adjusted to a uniform 35-year period; for stations of 10 to 14 years of record the means for the period of record are used. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for April, 1943

GENERAL SUMMARY

The weather during May, 1943, in New England was not unduly remarkable. Warmth increased approximately 10° during the month, with average temperatures about normal. There were outstanding warm periods around the 8th, 17-18th and 24-25th, with one record of 90° in southeastern New Hampshire. The retarding effect on agriculture of previous cold weather was gradually moderated into more advantageous conditions, and facilitated plantings which had been delayed. Although the season was unusually late, farm and crop conditions at the close of the month were much more reassuring. Freezing temperatures were general on the 2d, which date marked the beginning of the growing season over much of southern and coastal regions. Elsewhere, the beginning of the frost-free season was not reached until the 15th or 16th, The month was very generously rainy over all portions of New England except extreme northern Maine, where moisture was ample from earlier abundant rains. Water supplies for power installations, general welfare purposes and agriculture were more than ordinarily adequate. In the three northern States, somewhat more snow fell than usual for the season on the 1st, but a warm wave several days later removed all of it except such as usually remains in the deep northern ravines of the mountains. There was a deficiency of sunshine, with a corresponding surplus of cloudiness and a greater frequency of rain.

TEMPERATURE

The average monthly temperature for the Section, based on 109 records, was 54.9°, which is 0.3° below the mean for the past 56 years. The average temperature for the northern division was 53.1°; for the southern division, 56.8°. The highest monthly mean was 61.4° at Springfield, Mass.; the lowest was 47.4° at Lake Frontiere, Me. The highest recorded was 90° at Durham, N. H. on the 17th; the lowest was 20° at Bloomfield, Vt. on the 2d, Fort Kent, Me. on the 3d. and Lake Frontiere, Me. on the 3d and 14th. The greatest monthly range was 66° at Fort Kent, Me.; the least was 34° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 5.04 inches, which is 1.68 inches above the mean for the past 56 years. The average precipitation for the northern division was 4.71 inches; for the southern division, 5.37 inches. The greatest monthly amount reported was 10.91 inches at Searsburg Mt., Vt.; the least was 1.89 inches at Fort Kent, Me. The greatest amount in 24 hours was 2.47 inches at Lewiston, Me. on the 26-27th, The average number of days with .01 inch or more of precipitation was 15, which is 4 above the mean for the past 56 years.

The average snowfall for the northern division, based on 94 records, was 0.5 inch; for the southern division, based on 98 records, zero; for the Section, based on 192 records, 0.3 inch, which is 0.1 inch above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was southwest. The average velocity, based on the records at 15 stations, was 8.7 miles per hour, which is 1.0 mile per hour below the mean.

The sunshine, based on the records at 14 stations, averaged 51 percent of the possible amount, which is 5 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 136 records, was 9 clear, 9 partly cloudy, and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 75 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

DATES OF MISCELLANEOUS PHENOMENA

Auroras.— 1-2d, 6-7th, 14th, 20th, 23d, 25th, 27th.

Halos, lunar.— 9th, 15th, 19-20th.

Halos, solar.— 2d, 7th, 11th, 16th, 18th, 20-21st, 24-25th.

Hail.— (dates and general location)— 3d, Pittsfield, Mass., West Cummington, Mass.; 8th, Concord, Mass.; 18th, Danbury, Conn., New Haven, Conn.; 27th, Pittsfield, Mass., Provincetown, Mass., Stockbridge, Mass.; 29th, Winslow, Me.

Thunderstorms.—1st, 3d, 6-13th, 16-20th, 22d, 24th, 26-30th.

Fog, dense.— 1st, 3-4th, 7-9th, 11-23d, 25-31st.

Frosts.—(dates and general locations of last killing frosts during month)— Along immediate north coast, and in southern division, except western and north-central Mass. and northwestern Conn., on the 2d; elsewhere, generally on 15th and 16th. (In sheltered areas along immediate coast of southern division, last killing frost recorded in April.)

Sleet.— 3d, First Connecticut Lake, N. H.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for May, 1943

VOL. LV. BOSTON, MASS., JUNE, 1943. No. 6.

GENERAL SUMMARY

New England summer in its highly delightful aspects was typically characteristic of June in 1943. Rapidly increasing warmth into the high 90's developed by the 3d, accompanying lowest pressure of the month, and attendant upon a mass of maritime polar air being overrun by maritime tropical. Similar high temperatures recurred at about the beginning of the final week of the month. In several localities in the three southern States, this was the warmest June of record. Rainfall was adequate, and vegetation showed marked progress after a late start. As for agriculture from an economic viewpoint, delayed or interrupted advance was caused by too much moisture in the three northern States, and by some destruction from wash-outs, lightning and hail in the New Haven-Wallingford, Conn. area; the Kennebunk-Lewiston, Me. area; and the Boston-North Shore area. In the three northern States, there were many occurrences of frost or freezing on the 9-10th, with unimportant damage other than a delaying of growth, and some resultant replanting of seed. Towards the close of the month, agriculture was progressing very rapidly under lush tropical warmth and moisture, but in Rhode Island and eastern Connecticut soil conditions were becoming too dry, and drought characteristics were becoming threatening there.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 67.0°, which is 2.9° above the mean for the past 56 years. The average temperature for the northern division was 64.4°; for the southern division, 69.6°. The highest monthly mean was 74.0° at Springfield, Mass. and Waterbury, Conn.; the lowest was 55.8° at Eastport, Me. The highest recorded was 99° at East Wareham, Mass. on the 25th; the lowest was 27° at Lake Frontiere, Me. on the 9th and 10th. The greatest monthly range was 60° at Hillsboro, N. H.; the least was 39° at Nantucket, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 3.46 inches, which is 0.01 inch below the mean for the past 56 years. The average precipitation for the northern division was 4.46 inches; for the southern division, 2.49 inches. The greatest monthly amount reported was 10.11 inches at West Stewartstown., N. H.; the least was 1.05 inches at New Bedford, Mass. The greatest amount in 24 hours was 4.42 inches at First Connecticut Lake, N. H.. on the 15-16th, The average number of days with .01 inch or more of precipitation was 11, which is 1 above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 126 records, was southwest. The average velocity, based on the records at 16 stations, was 8.5 miles per hour, which is 0.2 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 67 percent of the possible amount, which is 8 percent above the mean.

Cloudiness was near the the mean. The average for the Section, based on 131 records, was 12 clear, 10 partly cloudy, and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 75 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for June, 1943

VOL. LV. BOSTON, MASS., JULY, 1943. No. 7.

GENERAL SUMMARY

The surplus heat of June projected, with but brief interruption, into July of 1943 over New England, and persisted to the last few days of the month. Daily mean temperatures from the 9th through the 28th were almost consecutively above normal, and, in Boston, this period of the month averaged more than 5 degrees above normal. When consideration is taken of the fact that this is the exact mid-summer season, with above normal heat accumulating at its maximum, it becomes evident that personal and physical discomforture were intensified to a degree considerably higher than is ordinarily endured. Moderately cool weather during the first week and the closing three days reduced somewhat the accumulation of excess heat obtained during the intervening period. With rainfall measurably above normal, and with average humidity, conditions were more than ordinarily favorable for growth of vegetation. However, winds, high temperatures and abundant sunshine, and the absence of appreciable rainfall from the 6th to the 21st depleted soil moisture to nearly an optimum for plant development. There were three periods of moderate to heavy rains: the 5th, 23d and 29th. These occurrences were occasioned by the overspreading of the Section by maritime tropical air masses of notably low atmospheric pressure. Some soil washing resulted from the storm of the 5th, and minor hail damage occurred at scattered times and places with probably slightly more than usual frequency. Characteristically, departure from the normal of the mean temperature of July in New England is slighter than that of any other month, and July of 1943 ran true to this condition, despite the unusually long and intensive warm spell.

TEMPERATURE

The average monthly temperature for the Section, based on 104 records, was 69.8°, which is 0.7° above the mean for the past 56 years. The average temperature for the northern division was 68.1°; for the southern division, 71.5°. The highest monthly mean was 75.4° at Haverhill, Mass.; the lowest was 60.2° at Eastport, Me. The highest recorded was 97° at Woodland, Me. on the 12th; the lowest was 31° at Somerset, Vt. on the 1st and 2d. The greatest monthly range was 59° at Adams, Mass.; the least was 26° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 4.34 inches, which is 0.58 inch above the mean for the past 56 years. The average precipitation for the northern division was 4.28 inches; for the southern division, 4.39 inches. The greatest monthly amount reported was 8.21 inches at Adams, Mass.; the least was 1.80 inches at Greenville, Me. The greatest amount in 24 hours was 4.60 inches at Hyannis, Mass. on the 7-8th. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 124 records, was southwest. The average velocity, based on the records at 15 stations, was 7.3 miles per hour, which is 0.8 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 63 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was near the the mean. The average for the Section, based on 130 records, was 12 clear, 11 partly cloudy, and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 78 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries †††. Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for July, 1943

VOL. LV. BOSTON, MASS., AUGUST, 1943. No. 8.

GENERAL SUMMARY

Rainfall in August, 1943, showed unusually marked contrast between northern and southern portions of New England. Computed values provide the following comparative date: Average rainfall in northern New England was 5.00 inches, which is more than 40 percent above normal; in southern New England, 2.27 inches, which is more than 40 percent below normal. Average number of days with .01 inch or more of precipitation in northern New England was 14; in southern New England, 8. Active ''fronts'' lying across the boundary of the two divisions, or crossing the northern division with greater intensity, account for the unequal distribution of rainfall. Cloudiness followed the pattern of distribution and frequency of rainfall, there being an average of 11 cloudy days in the northern division, and less than 8 in the southern division. During the latter half of the month in the southern division rainfall was much less frequent and generally of smaller amount as compared with the first half. In most of Rhode Island and eastern Connecticut, there was recorded but one day (27th) on which measurable rain occurred after the 14th. Drought conditions in that area intensified steadily, remaining acute to the close of the month. The month was about normal as to temperature for the Section as a whole, it being slightly cooler in the north, and a little warmer than normal in the southern division. On the 2d, temperature readings reached the lower and middle 90's, which was the warmest day of the month. Lowest temperatures were generally recorded during the last decade, except in Maine where the coolest weather occurred on the 8th, with extremes generally near or slightly below 40°. E.S.

TEMPERATURE

The average monthly temperature for the Section, based on 106 records, was 66.7°, which is 0.3° below the mean for the past 56 years. The average temperature for the northern division was 64.4°; for the southern division, 68.9°. The highest monthly mean was 72.2° at Providence, R. I.; the lowest was 59.4° at Lake Frontiere, Me. The highest recorded was 96° at Brockton, Mass. and Providence, R. I on the 2d; the lowest was 33° at Lake Frontiere, Me. on the 8th and 29th. The greatest monthly range was 54° at Farmington, Me.; the least was 24° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 3.62 inches, which is 0.17 inch below the mean for the past 56 years. The average precipitation for the northern division was 5.00 inches; for the southern division. 2.27 inches. The greatest monthly amount reported was 10.00 inches at Cadillac Mountain, Me.; the least was 0.71 inch at Westfield, Mass. and West Hartland, Conn. The greatest amount in 24 hours was 5.18 inches at Cadillac Mountain, Me. The average number of days with .01 inch or more of precipitation was 11, which is 1 above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 124 records, was southwest. The average velocity, based on the records at 15 stations, was 7.2 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 62 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 132 records, was 11 clear, 11 partly cloudy, and 9 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 81 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

DATES OF MISCELLANEOUS PHENOMENA

Auroras.—1-3d, 6-8th, 10th, 15th, 18-20th, 24-26th, 28-31st.

Halos, lunar.— 21st.

Halos, solar.—1st, 2d, 9th, 16th, 21st, 26th, 27th, 29th.

Hail.—(dates and general location)—8th, Collinsville, Cream Hill and Washington, Conn.; 30th, Lakeport, N. H.

Thunderstorms.—1-18th, 21-24th, 26th, 30th.

Fog, dense.—1-30th.

Frosts.—(dates and general locations of last killing frosts during month)— None.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for August, 1943

CLIMATOLOGICAL DATA

NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR: (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LV. BOSTON, MASS., SEPTEMBER 1943. No. 9.

GENERAL SUMMARY

Weather conditions in New England during September, 1943, averaged close to the seasonal normal, except for a noteworthy lack of rain which was more pronounced in the southern division and particularly in its eastern portions. While the average monthly total was greater than that of the year of 1941, the month was otherwise the driest September since 1930. Rainfall frequency and amounts were generally adequate up to the 17th, but after that date, there were but a few scattered showers on the 22-23d and the 30th in Maine and the southern division, and very little elsewhere. A storm of considerable force from off the southeastern shores of the country advanced toward New England during early hours of the 14th, and veered somewhat to the northeastward near Nantucket, accompanied by the heaviest shore rainfall of the month. Lowest barometer readings developed on the 15th, and Nantucket reported a maximum wind velocity of 43 miles per hour for 5 minutes on the 15th. Extraordinarily high tides accompanied this storm from Cape Cod northeastward. Cold polar air advanced over New England on the 29th, with accompanying highest pressure readings of the month, and scattered occurrences of subfreezing in extreme northern margins of the Section. First frosts occurred at this time, but with smaller distribution and less intensity than is usual for September. The longest warm period was approximately from the 6th to the 10th, other warm weather lasting but a brief day or so. Subnormal daily temperatures were reported a little oftener than half the month.

TEMPERATURE

The average monthly temperature for the Section, based on 106 records, was 58.9°, which is 1.3° below the mean for the past 56 years. The average temperature for the northern division was 56.3°; for the southern division, 61.4°. The highest monthly mean was 65.0° at New London, Conn.; the lowest was 52.2° at First Connecticut Lake, N. H. and Somerset, Vt. The highest recorded was 94° at Weston, Mass. on the 7th; the lowest was 19° at Lake Frontiere, Me. on the 29th. The greatest monthly range was 66° at Lake Frontiere, Me.; the least was 32° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 1.82 inches, which is 1.93 inches below the mean for the past 56 years. The average precipitation for the northern division was 2.23 inches; for the southern division, 1.42 inches. The greatest monthly amount reported was 4.52 inches at Middledam, Me.; the least was 0.34 inch at Nashua, N. H., Kenoza Lake, (Haverhill) Mass. and Millbury, Mass. The greatest amount in 24 hours was 3.08 inches at Norwalk, Conn. on the 14-15th. The average number of days with .01 inch or more of precipitation was 8, which is 1 below the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 125 records, was northwest. The average velocity, based on the records at 14 stations, was 8.0 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 56 percent of the possible amount, which is 2 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 129 records, was 12 clear, 8 partly cloudy, and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 81 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

DATES OF MISCELLANEOUS PHENOMENA

Auroras.— 1-6th, 8th, 10-12th, 17th, 18th, 20th, 21st, 23d, 25-30th.

Halos, lunar.— 1st, 12-15th, 21st, 25th.

Halos, solar.—2d, 13-15th, 20th, 21st, 23d, 24th, 26th, 29th, 30th.

Hail.—(dates and general location)—7th, Mays Mill, Vt. and Salisbury, Conn.; 9th, Gilman, Vt. and Springfield, Mass.; 11th, Newport, Vt.; 17th, Wood River Jct., R. I.

Thunderstorms.—1st, 2d, 6-11th, 14-17th.

Fog, dense.—1st, 2d, 4-23d, 25th, 26th, 28-30th.

Frosts.—(dates and general locations of first killing)—12-14th, in the more susceptible places of interior northern New England and the Berkshires; 18-19th, lowlands and other susceptible places throughout Section; 26-28th, highlands of northwestern Connecticut.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for September, 1943

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LV. BOSTON, MASS., OCTOBER, 1943. No. 10.

GENERAL SUMMARY

General weather conditions in New England during October, 1943, were approximately typical of the mid-autumn month, the greatest abnormalities being a surplus of rain and cloudiness. However, the moisture deficit from the 3d to the 15th was too great for the later surplus to overcome the lack of ground water. This long dry period was of great benefit to agriculturists in completing their late harvests to the best advantage, and to make preparations for customary winter chores. A storm of modified hurricane characteristics went past this coast on the 16-17th, but without noteworthy damage, and another storm occurred on the 26-27th; both of these causing lowest pressure readings and maximum wind velocities of the month. During each of these storms, maximum 24-hour rainfall amounts exceeded 2 inches generally, and, in a few instances, were nearly 4 inches. Temperatures were slightly subnormal during the 2d and 4th weeks, but the month as a whole was a fraction of a degree warmer than normal. At the close of the month there was great need for clear, cold and dry weather.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 49.8°, which is 0.3° above the mean for the past 56 years. The average temperature for the northern division was 47.9°; for the southern division, 51.8°. The highest monthly mean was 56.3° at New Bedford, Mass.; the lowest was 42.8° at Somerset, Vt. The highest recorded was 84° at Providence, R. I. on the 9th; the lowest was 14° at Somerset, Vt. on the 11th. The greatest monthly range was 62° recorded at 6 stations; the least was 27° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 5.27 inches, which is 1.74 inches above the mean for the past 56 years. The average precipitation for the northern division was 5.47 inches; for the southern division, 5.07 inches. The greatest monthly amount reported was 9.86 inches at Rockland, Me.; the least was 2.53 inches at Block Island, R. I. The greatest amount in 24 hours was 3.90 inches at Burlington, Conn. on the 26-27th. The average number of days with .01 inch or more of precipitation was 13, which is 4 above the mean for the past 56 years.

The average snowfall for the northern division, based on 94 records, was 0.2 inch; for the southern division, based on 98 records, was 0.0 inch; for the Section, based on 192 records, 0.1 inch, which is 0.1 inch below the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was northwest. The average velocity, based on the records at 14 stations, was 9.9 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 41 percent of the possible amount, which is 12 percent below the mean.

Cloudiness was considerably above the mean. The average for the Section, based on 130 records, was 9 clear, 6 partly cloudy, and 16 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 80 percent, which is 1 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

NOTE: Observations taken at 7:30 a. m. E. S. T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for October, 1943

VOL. LV. BOSTON, MASS., NOVEMBER 1943. No. 11.

GENERAL SUMMARY

New England's weather during November, 1943, was featured by an unusually heavy snowstorm on the 22-23d over most of northern New England except eastern Maine and southeastern New Hampshire, and in the Berkshires. The full weight of the storm settled in central parts of Coos County, New Hampshire, where snow depths of record proportion for a single storm occurred. At Randolph, N. H., 56 inches of snow was recorded; at Berlin, N. H., 55 inches; at Pinkham Notch (Carroll County), N. H., 51 inches; and there were other reports of snow depths in excess of 40 inches. The storm was reminiscent of the terrible storm of the Saturday after Thanksgiving in 1898, although lacking the extreme wind velocities of the earlier storm, and without the tragic occurrences of the 1898 storm along the coast and at sea. This storm started within our sphere of observation in northern Minnesota on the 20th, and was rapidly occluding over Pennsylvania on the 21st. It then moved over eastern Massachusetts and became almost stationary near Boston, attended by a steady flow of moist air from off the Atlantic. The snowstorm occurred while the disturbance was in that location, its easterly progress temporarily stalled. The average monthly precipitation for the Section as a whole was considerably above normal; the temperature averaged a fraction of a degree colder than normal. Stream flow and ground water levels were definitely high, and in one instance in southwestern Maine, flow was greater than in any other November. This month of November is normally about the mid-season when occurrences of sub-tropical and sub-arctic air masses come in sharp conflict, with resulting confluences rather difficult for business and public adjustments.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 37.3°, which is 0.7° below the mean for the past 56 years. The average temperature for the northern division was 34.6°; for the southern division, 40.1°. The highest monthly mean was 45.8° at Nantucket, Mass.; the lowest was 27.9° at Lake Frontiere, Me. The highest recorded was 70° at Plymouth, Mass. on the 9th; the lowest was −5° at Lake Frontiere, Me. on the 30th. The greatest monthly range was 66° at Dorset, Vt.; the least was 29° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 5.08 inches, which is 1.57 inches above the mean for the past 56 years. The average precipitation for the northern division was 5.77 inches; for the southern division, 4.42 inches. The greatest monthly amount reported was 14.16 inches at Pinkham Notch, N. H.; the least was 1.91 inches at Provincetown, Mass. The greatest amount in 24 hours was 5.46 inches at Pinkham Notch, N. H. on the 22-23d. The average number of days with .01 inch or more of precipitation was 12, which is 2 above the mean for the past 56 years.

The average snowfall for the northern division, based on 89 records, was 19.7 inches; for the southern division, based on 86 records, 5.1 inches; for the Section, based on 175 records, 12.5 inches, which is 7.7 inches above the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was northwest. The average velocity, based on the records at 14 stations, was 9.4 miles per hour, which is 1.4 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 49 percent of the possible amount, which is 5 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 131 records, was 9 clear, 8 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 12 stations, was 80 percent, which is 4 percent above the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.**)

Dates of Miscellaneous Phenomena

Auroras.— 1st, 3d, 7th, 24-28th.

Halos. lunar.— 5-7th, 9th, 12-14th, 19th, 21st.

Halos. Solar.— 1st, 5th, 10th, 11th, 13th, 15th, 19-21st, 26-28th.

Hail.—(dates and general location)— 6th, Upper Dam, Me., Pinkham Notch, N. H., Lemington, Vt.; 11th, Block Island, R. I.

Thunderstorms.— 6th, central Me., extreme northern N. H. and northwestern Vt.; 9th, Litchfield County, Conn.; 11th, central and southern R. I.; 13th, Nantucket, Mass.; 22d, Portland, Me. and Gloucester, Swampscott and Nantucket, Mass.

Fog, dense.—1st, 2d, 4-10th, 15-23d, 25-28th.

Frosts.—(dates and general locations of first killing)— Killing frost penetrated Islands off south coast on 15th or 18th; previously recorded elsewhere in Section.

Sleet.—(dates, division, number of stations reporting; N-north, S-south.)—3d, N1; 4th, N1; 5th, S1; 8th, N1; 9th, N1; 11th, N2, S1; 12th, N1; 15th, S3; 16th, S1; 22d, N9, S5; 23d, N15, S6; 24th, N1; 27th, N1; 30th, S1.

Waterspout.—On the morning of the fifth of November, 1943, a waterspout occurred in Casco Bay about eight miles to the eastward of Portland, Me. and about one and one-half miles to the south-southeastward of Halfway Rock, which is on the outer margin of Casco Bay. From about 7:30 a.m. to 7:45 a.m., the spout was seen moving from a point about one to one and one-half miles to the south-southeastward and moving toward the Rock, but did not reach it. The Observer described it as a "large dark whirling tube extending in a slanting position from water to cloud." It lifted from the water as it disappeared into the cloud. Shortly thereafter, another and smaller spout at a greater distance was observed moving in the same direction and quickly disappearing. Where these spouts touched, the water seemed to be shrouded in mists, and the Observer with a glass could see spurts of ocean water shooting ten feet or more into the air.

As to other spouts in Portland's history: none have been reported in cold weather, but others have occurred May 22, 1921, 2:45 p.m. at Long Island; October 6, 1926 at about the same location as that of November 5, 1943; May 16, 1929, at Sebago Lake, and at Portland and Kezar Falls as tornados.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries   ††† Observer for New England Power Co.   T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement.   ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.   ‡ Precipitation measured with recording gage.   ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs.   § Also on other dates.

Daily Precipitation for November, 1943

VOL. LV. BOSTON, MASS., DECEMBER, 1943. No. 12.

GENERAL SUMMARY

New England's weather during December, 1943 was considerably colder than normal, and precipitation was over 60 percent below normal for the section as a whole. In the northern division, the temperature was decidedly subnormal, while the average total snowfall approached usual December depths. Snowfall was greatly deficient in the southern division, averaging less than half an inch, while the negative temperature departure was less marked than that of the northern division. This distribution of temperature and snowfall in the two divisions of the Section gave the impression of gentle winter weather in the three southern states, and near normal winter conditions in the northern division. Lowest monthly temperatures and highest barometric pressures occurred on the 24th, with thermometer readings more than 30° below zero in extreme northern portions, and more than 10° below zero in the Berkshires; highest barometer readings ranged from 30.66 to 30.51 inches. On the 11th, following the passage of a rapidly moving cold front, northwest winds reaching whole gale force swept the Section causing considerable damage over widespread areas. The maximum velocity recorded was 70 miles per hour at Block Island, R. I. The center of the disturbance associated with the cold front passed over northern New England, with lowest pressure readings of the month (29.13 inches at Portand, Me.). Generally speaking, the weather this December was somewhat characteristic of early winter in this Section. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 106 records, was 21.8°, which is 4.7° below the mean for the past 56 years. The average temperature for the northern division was 16.9°; for the southern division, 26.7°. The highest monthly mean was 33.1° at Nantucket, Mass.; the lowest was 8.0° at Lake Frontiere, Me. The highest recorded was 59° at Westbrook, Conn. on the 9th; the lowest was −35° at Bloomfield, Vt. on the 24th. The greatest monthly range was 77° at Bloomfield, Vt.; the least was 46° at Nantucket, Mass. and Rockport, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 0.99 inch, which is 2.32 inches below the mean for the past 56 years. The average precipitation for the northern division was 0.99 inch; for the southern division, 0.99 inch. The greatest monthly amount reported was 2.33 inches at First Connecticut Lake, N. H.; the least was 0.40 inch at Turners Falls, Mass. The greatest amount in 24 hours was 1.52 inches at Norwalk, Conn. and Westbrook, Conn. on the 26-27th. The average number of days with .01 inch or more of precipitation was 6, which is 4 below the mean for the past 56 years.

The average snowfall for the northern division, based on 86 records, was 9.2 inches; for the southern division, based on 88 records, 0.4 inch; for the Section, based on 174 records, 4.8 inches, which is 6.1 inches below the mean for the past 56 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 114 records, was northwest. The average velocity, based on the records at 14 stations, was 9.9 miles per hour, which is 1.0 miles per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 59 percent of the possible amount, which is 15 percent above the mean.

Cloudiness was below the mean. The average for the Section, based on 126 records, was 12 clear, 8 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 70 percent, which is 7 percent below the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.**)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for December, 1943

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS). REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LV. BOSTON, MASS., ANNUAL, 1943. No. 13.

GENERAL SUMMARY.

In summarizing weather conditions throughout New England it is interesting to note, as is usually the case, that annual statistics of warmth and moisture do not have any great significance, as the area covered is too varied in its climatic characteristics, both seasonally and the time period too long.

The year under review was slightly below normal in both temperature and precipitation. January and December, two of the coldest months, and April, were decidedly subnormal in warmth; while June and July were a little warmer than normal. The increase in warmth from the end of April through June was very rapid, and the fall in temperature from the end of October through the end of the year, was also more rapid than the usual progression. In January the unrelenting cold during the early part of the month, caused considerable suffering because of fuel shortages occasioned by wartime demands. An outstanding occurrence of temperature range (101°) was reported at East Barnet, Vermont, between the 16th and 23d of Febr-

[Continued on page 102]

The average annual temperature for the Section was 44.8°, which is 1.1° below the mean for the past 56 years. The average temperature for the northern division was 42.0°; for the southern division, 47.8°. The highest annual mean temperature was 51.1° at Chestnut Hill, Massachusetts; the lowest was 36.3° at Caribou, Maine. The highest temperature reported was 99° at East Wareham, Massachusetts on June 25th; the lowest was -46° at East Barnet, Vermont, on February 16 and 17. The annual range for New England was 145°; the greatest local annual range was 135° at Bloomfield, East Barnet, St. Johnsbury and Woodstock, Vermont; the least local annual range was 93° at Nantucket, Massachusetts.

The average annual precipitation for the Section was 40.41 inches, which is 1.58 inches below the mean for the past 56 years. The average precipitation for the northern division was 42.53 inches; for the southern division, 38.38 inches. The average annual snowfall for the northern division was 87.8 inches; for the southern division, 44.8 inches; and for the Section, 66.6 inches, which is 3.2 inches above the mean for the past 56 years. The greatest annual precipitation was 54.16 inches at Searsburg Mountain, Vermont; the least annual amount was 27.79 inches at Brockton, Massachusetts. The greatest local monthly amount was 14.16 inches at Pinkham Notch, New Hampshire, in November; the least local monthly amount was 0.34 inch at Nashua, New Hampshire, and Kenoza Lake (Haverhill) and Millbury, Massachusetts, in September. The greatest amount in any 24 hours was 5.46 inches at Pinkham Notch, New Hampshire, on November 22-23d. The average number of days with .01 inch or more of precipitation was 131, which is 9 above the mean for the past 56 years.

The prevailing direction of the wind was northwest. The average velocity was 9.4 miles per hour, which is 0.6 mile per hour below the mean. The maximum velocity recorded during the year was 71 miles per hour from the west, on August 2d at Caribou, Maine.

The sunshine averaged 55 percent of the possible amount, which is 2 percent above the mean for the past 50 years. Cloudiness was somewhat above the mean; the average for the Section was 126 clear, 101 partly cloudy, and 138 cloudy days.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

[Continued from page 97]

uary, with a minimum thermometer reading of minus 46°. The Arctic cold which overspread the Section from the 15th to the 17th of February was particularly severe.

Rigorous weather continued along the extreme northern boundaries of Maine during March, and at the mid-month period, the snow was 6½ feet deep at Fort Kent.

April was the coldest April of record since averages of the Section were first compiled in 1888. A damaging thunder, snow storm occurred on the 13-14th, and snowplows were required in drifted highways in the Berkshires. At Pinkham Notch, N. H., the total of new snow for the month was 40 inches.

Temperatures reached the top 80's in May, and 99° in June, and in some southern stations it was the warmest June on record. During July much of the deficiency of the agricultural situation was overcome, and tropical air masses overspread the entire area during much of the month. During the latter half of August drought conditions developed with increasing intensity in Rhode Island and eastern Connecticut, while in northern New England the average rainfall was 5 inches. The drought gradually spread over the greater part of New England during September, which showed the lowest rainfall for the month since 1930. Cold polar air advanced over the Section on the 29th, and was the practical termination of summer conditions. The drought conditions continued over the earlier half of October, and proved to be advantageous to a satisfactory completion of harvests, but the water supply deficiency was acute and was not entirely restored by later surplus rain during the month. Ground waters were restored to surplus levels in November.

An unusually heavy snowstorm covered nearly all northern New England on November 22-23d, with major exceptions over eastern Maine. The recorded amounts exceeded 50 inches for the storm in parts of Coos County, New Hampshire, and there were many reports of over 40 inches. The storm advanced eastward from Minnesota on the 20th, occluding over Pennsylvania on the 21st, and becoming relatively stationary near Boston. Snow was deficient in December but the cold weather made the month one of the outstanding cold Decembers of record.

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVI. BOSTON, MASS., JANUARY, 1944. NO. 1.

GENERAL SUMMARY

New England's weather during January, 1944 was less severe than that usually experienced in this mid-winter month, and was especially so in the southern division (except the Berkshires) and in Aroostook and Penobscot Counties, Maine. In the southern division, snowfall averaged less than half of normal, and the ground was bare, or nearly so, most of the time; temperature averaged somewhat above normal, and there was a noticeable absence of extreme minima. In Aroostook and Penobscot Counties, the month was one of the driest of record, and, relatively, even less severe than it was in the southern division; total snowfall was less than 3 inches, and temperature averaged 4° to 7° above normal. At Millinocket, Me., total precipitation was 0.07 inch, snowfall was 0.9 inch, and the temperature departure from normal was +5.0°; at Caribou, Me., corresponding values were 0.12, 2.2, and +7.2. Elsewhere in the northern division and the Berkshires, the weather more nearly approached normal mid-winter conditions as to temperature and snowfall, although precipitation was markedly subnormal. On the 6-7th, a coastal disturbance, passing south and east of New England, produced the heaviest general precipitation and snowfall of the month. Maximum 24-hour amounts of precipitation, however, occurring mostly as rain, were produced by another coastal disturbance on the 3d-4th affecting, principally, the coasts of Rhode Island and Connecticut and Cape Cod. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 109 records, was 23.8°, which is 1.3° above the mean for the past 57 years. The average temperature for the northern division was 19.7°; for the southern division, 28.2°. The highest monthly mean was 32.8° at Nantucket, Mass. and New Bedford, Mass.; the lowest was 12.2° at Lake Frontiere, Me. The highest recorded was 63° at Norwalk, Conn. on the 27th; the lowest was −32° at Lemington, Vt. on the 17th. The greatest monthly range was 78° at Gardiner, Me.; the least was 36° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 1.76 inches, which is 1.65 inches below the mean for the past 57 years. The average precipitation for the northern division was 1.52 inches; for the southern division, 2.00 inches. The greatest monthly amount reported was 4.02 inches at Bridgeport, Conn.; the least was 0.07 inch at Millinocket, Me. The greatest amount in 24 hours was 2.65 inches at Portsmouth, R. I. on the 3d-4th. The average number of days with .01 inch or more of precipitation was 7, which is 4 below the mean for the past 57 years.

The average snowfall for the northern division, based on 93 records, was 16.9 inches; for the southern division, based on 82 records, 6.1 inch; for the Section, based on 175 records, 11.8 inches, which is 3.6 inches below the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 123 records, was northwest. The average velocity, based on the records at 14 stations, was 9.7 miles per hour, which is 1.3 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 55 percent of the possible amount, which is 8 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 135 records, was 12 clear, 8 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 77 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ^{a},^{c},^{e}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont – Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut – Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for January, 1944

VOL. LVI. BOSTON, MASS., FEBRUARY, 1944. No. 2.

GENERAL SUMMARY

Weather in New England during February, 1944, did not vary greatly from normal late winter conditions of this region. In the southern division, though the month was but fractionally warmer than normal, the absence of extreme minimum temperatures, subnormal snowfall and bare ground much of the time gave the impression of unusually mild winter weather. Considering that the preceding two months were also less severe than usual, this impression of a mild winter was further accentuated by a comparison with the bitter weather of the preceding winter, still fresh in the public mind. The only snowstorm of consequence in the southern division occurred on the 11-12th, with depths ranging from about 6 to more than 10 inches. In the northern division, the usual frequency of rigorous weather and a greater than normal volume of snow rounded out a winter typically harsh and confining. Over the Section as a whole, a considerable deficiency of warmth was accumulated during the first two decades. This deficiency was nearly equalized or overcome by a moderate warm spell lasting, almost without interruption, from about the 21st to the close of the month. Monthly minimum temperatures were recorded on the 9th and 19th; monthly maxima, generally on the 24th. A thunderstorm occurred over parts of central and southern New England in the early morning of the 23d, an infrequent winter phenomenon in this region. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 106 records, was 22.2°, which is 0.5° below the mean for the past 57 years. The average temperature for the northern division was 17.7°; for the southern division, 27.0°. The highest monthly mean was 31.8° at New London, Conn.; the lowest was 8.0° at First Connecticut Lake, N. H. The highest recorded was 59° at Norwalk, Conn. on the 24th; the lowest was −36° at Lake Frontiere, Me. on the 9th. The greatest monthly range was 83° at Lake Frontiere, Me.; the least was 36° at Nantucket, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 188 records, was 2.48 inches, which is 0.58 inch below the mean for the past 57 years. The average precipitation for the northern division was 2.70 inches; for the southern division, 2.26 inches. The greatest monthly amount reported was 5.24 inches at Machias, Me.; the least was 1.13 inches at Bethlehem, N. H. The greatest amount in 24 hours was 1.47 inches at Pinkham Notch, N. H., on the 14-15th. The average number of days with .01 inch or more of precipitation was 9, which is the mean for the past 57 years.

The average snowfall for the northern division, based on 89 records, was 24.0 inches; for the southern division, based on 85 records, 9.0 inches; for the Section, based on 174 records, 16.7 inches, which is 0.4 inch above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was northwest. The average velocity, based on the records at 14 stations, was 10.3 miles per hour, which is 1.4 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 58 percent of the possible amount, which is 7 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 135 records, was 12 clear, 7 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 73 percent, which is 2 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for February, 1944

23 NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVI. BOSTON, MASS., MARCH, 1944. No. 3.

GENERAL SUMMARY

Winter conditions persisted well on to the close of March throughout New England in 1944. The cold weather was more intense than normal, and there was a slight excess of snowfall. More snow fell during the latter half of the month than in the earlier portion, and more of it fell in central New England than in other portions of the Section. The greatest snowfall for the month was 35 inches at Pinkham Notch, N. H., which probably received some of the snow from Mt. Washington, where the monthly total was only 11.4 inches. There was also a considerable surplus of snow over southwestern Vermont. Stream flow was subnormal, and the precipitation caused only inconsiderable increases during the month. Precipitation was somewhat subnormal over northern and northwestern Vermont and somewhat generally so over central and northern Maine.

The only periods of above normal warmth were the 7-8th, 12-13th, and the 24-26th, principally over central and southern parts, and there were but few scattered localities where temperatures were not appreciably subnormal. Sunshine and wind did not differ importantly from the usual conditions experienced in March, and, all factors considered, the month was hardly less severe than ordinarily prevails. Highway travel conditions were much better than is frequently the case at this, the practical termination of winter. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 107 records, was 29.2°, which is 2.9° below the mean for the past 57 years. The average temperature for the northern division was 25.9°; for the southern division, 32.5°. The highest monthly mean was 36.7° at New Bedford, Mass.; the lowest was 15.7° at First Connecticut Lake, N. H. The highest recorded was 66° at East Wareham, Mass. on the 25th; the lowest was −28° at Lake Frontiere, Me. on the 11th. The greatest monthly range was 84° at Lake Frontiere, Me.; the least was 35° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 4.03 inches, which is 0.35 inch above the mean for the past 57 years. The average precipitation for the northern division was 3.28 inches; for the southern division, 4.78 inches. The greatest monthly amount reported was 8.50 inches at Bridgeport, Conn. and at Norwalk, Conn.; the least was 0.97 inch at Newport, Vt. The greatest amount in 24 hours was 2.98 inches at Nantucket, Mass., on the 13th. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 57 years.

The average snowfall for the northern division, based on 86 records, was 13.5 inches; for the southern division, based on 85 records, 10.4 inches; for the Section, based on 171 records, 12.0 inches, which is 0.7 inch above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 129 records, was northwest. The average velocity, based on the records at 14 stations, was 11.0 miles per hour, which is 0.4 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 57 percent of the possible amount, which is 5 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 134 records, was 12 clear, 8 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 70 percent, which is 4 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras — 1st, 2d, 18-22d, 24-29th.

Halos, lunar.— 1st, 3d, 4th, 6th, 15th.

Halos, Solar.— 3-6th, 12th, 14th, 15th, 18th, 19th, 22d, 23d, 28th, 29th, 31st.

Hail. –(dates and general location)— 17th, Marion, Conn.; 23d, Plymouth, Mass.; 27th, at many points along central Maine coast, in southern New Hampshire, and over a considerable area from northeastern Mass. to northwestern Conn.

Thunderstorms.— 25th, Pittsfield, Mass.; 16th, Stockbridge, Mass. and Norfolk, Conn.; 17th, scattered over eastern and central Mass. and southern R. I.; 23d, over south coastal areas east of the Connecticut River; 27th, general over central and western Mass. and western and extreme northern Conn., and scattered over southern N. H. and extreme southeastern Vt.

Fog, dense.— 7th, 8th, 13th, 15-17th, 20th, 21st, 23-25th, 27th, 28th, 30th, 31st.

Sleet.–(dates, division, number of stations reporting; N-north, S-south.)—6th, N-1, S-4; 7th, N-22, S-13; 8th, N-3, S-2; 9th, N-1; 12th, N-1; 13th, N-1; 14th, N-1; 15th, N-2, S-20; 16th, N-19, S-16; 17th, N-2; 19th, S-1; 20th, N-2, S-9; 21st, S-1; 23d, N-5, S-8; 27th, N-12; 28th, N-1; 29th, N-1, S-32; 30th, N-25, S-27; 31st, N-6.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries. ††† Observer for New England Power Co. T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVI. BOSTON, MASS., APRIL, 1944. NO. 4.

GENERAL SUMMARY

April weather in New England is not likely to vary to large extremes from its arithmetic averages, and conditions in 1944 were not greatly variable from the usual. There were brief warm spells on the 1-2d, 7th, 9-10th, 18-19th, and, the warmest, on the 30th. All the remaining days were distinctly subnormal, and the month as a whole was 3.2° subnormal, although slightly warmer than April, 1943. Precipitation after the first week was fairly frequent, but slightly deficient until the 24th when heavy rain partly restored the accumulated deficit in nearly all districts except extreme northern parts of the Section. Nearly all ramifications of agricultural operations were slightly hampered. The maple industry was backward, but frost was not leaving the ground in northern counties until toward the close of the month. Early plowing progressed throughout the month in the south. During the last week of the month, maple sugaring was nearly completed and the snow cover was mostly gone, except for some two inches of new snow in Aroostook County. The gradual recession of the snow cover was indicative of but slight hazard from spring freshets. There remained but approximately 16 to 20 inches of snow cover in the woods in the headwaters of the Connecticut River at the close of the month, and only about 6 inches of cover in the southern Green Mountains. In extreme northern Maine, stream flow was deficient at the close of the month, and the flow in the St. John River was the lowest in 26 years. Hydro-electric power storage was slightly greater than normal in Vermont and New Hampshire, but subnormal in Maine. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 40.4°, which is 3.2° below the mean for the past 57 years. The average temperature for the northern division was 37.7°; for the southern division, 43.1°. The highest monthly mean was 47.0° at Springfield, Mass.; the lowest was 30.4° at First Connecticut Lake, N. H. The highest recorded was 80° at Norwalk, Connecticut, on the 30th; the lowest was −10° at Lake Frontiere, Me. on the 5th. The greatest monthly range was 75° at Lake Frontiere, Me.; the least was 32° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 3.58 inches, which is 0.25 inch above the mean for the past 57 years. The average precipitation for the northern division was 3.01 inches; for the southern division, 4.15 inches. The greatest monthly amount reported was 5.70 inches at Hatchville, Mass.; the least was 0.92 inch at Caribou, Me. The greatest amount in 24 hours was 3.39 inches at Hatchville, Mass., on the 24-25th. The average number of days with .01 inch or more of precipitation was 10, which is the mean for the past 57 years.

The average snowfall for the northern division, based on 91 records, was 3.0 inches; for the southern division, based on 96 records, 0.1 inch; for the Section, based on 187 records, 1.5 inches, which is 2.6 inches below the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 128 records, was northwest. The average velocity, based on the records at 14 stations, was 9.2 miles per hour, which is 1.6 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 53 percent of the possible amount, which is 1 percent below the mean.

Cloudiness was near the mean. The average for the Section, based on 136 records, was 12 clear, 7 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 71 percent, which is 4 percent above the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.**)

Dates of Miscellaneous Phenomena

Auroras.— 1-3d, 10th, 13th, 15th, 19th, 23d, 24th, 27th.

Halos, lunar.— 2d, 4-9th, 27th, 29th, 30th.

Halos, Solar.— 1st, 2d, 4-6th, 9-11th, 15th, 21st, 23d, 26th, 27th, 29th, 30th.

Hail.—(dates and general location)— None.

Thunderstorms.— 16th, Nantucket and Pittsfield, Mass.; and Block Island, R. I.; 24th, Blue Hill, Mass., Block Island and Point Judith, R. I., and generally across Connecticut from Norwalk to Putnam.

Frosts.—(dates and general location)—Generally to the close of the month, except in the higher elevations and sheltered areas of the southern division east of the Connecticut River and in southwestern Conn.

Sleet.—(dates and general location)— Maine: 8th, 11-13th, 15-17th, 21st, 24th; New Hampshire: 8th, 11-13th. 15-17th, 24-25th; Vermont: 2d, 8th, 12th, 15-16th, 23-25th; Massachusetts: 11-12th, 15-16th, 23-24th; Rhode Island: 11th, 23d; Connecticut: 11-12th, 15th, 21st, 23-24th.

Earthquake.— Woodstock, N. H. on 11th, at 4:25 p.m., EWT; mild shock, duration 30 seconds.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ᵃ,ᵇ,ᶜ, etc. appearing in the table indicate number of days missing: for example, ᵇ represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H ; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

¹ Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. ² Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). ³ Thermometers not supplied by Weather Bureau. ⁴ Precipitation measured in morning recorded as of preceding date.

⁵ Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for April, 1944

Remittance payable to Superintendent of Documents, Washington, D. C.

Vol. LVI. Boston, Mass., MAY, 1944. No. 5.

GENERAL SUMMARY

Two serious weather conditions developed over New England during May 1944. First, a cumulative drought in many localities, and on the 19th freezing and heavy frosts, with acutely damaging results, particularly in central and southern New England. The first part of the month was extremely favorable for crop growth, with ample warmth and soil moisture, and weather favorable for pollination of fruit blooms. Later, severe cold and drought seriously negatived some of the earlier favorable conditions. A continuity of violent storms occurred over middle and eastern Massachusetts in the evening of May 16th, with fatal results from lightning, and with wind damage. Saturday, May 27th, in the late afternoon after unusually high maximum temperatures, there were reactions in central New England with violently heavy rains, wind squalls, and lightning. Hail fell in the Connecticut Valley in northern Connecticut, and in Maine to the eastward of Lake Sebago. In the northern division of the Section, it was the driest May since 1926, and in the southern division, the driest since 1903. In Boston, it was the driest May since 1826; and the end of the driest consecutive 12-months' period since the period from March 1910 through February 1911, when the total was 25.77 inches; the present being 27.93 inches. In the year 1822, Boston precipitation totaled 27.20 inches. Remarkably low rainfall during the month resulted in some 20% deficiency of stream flow in Massachusetts, Connecticut, and Rhode Island, and in extreme northern portions of Maine, New Hampshire, and Vermont.

Temperatures were above normal almost uninterruptedly during May, there being brief periods of subnormal warmth the 18-19th, and the 22-24th. It was the warmest May with one exception in each of the two divisions of the Section, since records were first compiled in 1888. Sunshine was somewhat above normal. Humidity, cloudiness, and wind force were deficient.

TEMPERATURE

The average monthly temperature for the Section, based on 109 records, was 59.7°, which is 4.5° above the mean for the past 57 years. The average temperature for the northern division was 58.1°; for the southern division, 61.4°. The highest monthly mean was 66.8° at Springfield, Mass.; the lowest was 50.8° at Eastport, Me. The highest recorded was 97° at Fitchburg, Mass. on the 31st; the lowest was 20° at Fort Kent, Me. and Bennington and Dorset, Vt. on the 19th. The greatest monthly range was 73° at Bennington, Vt.; the least was 40° at Nantucket, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 1.40 inches, which is 1.93 inches below the mean for the past 57 years. The average precipitation for the northern division was 1.61 inches; for the southern division, 1.19 inches. The greatest monthly amount reported was 4.45 inches at Dorset, Vt.; the least was 0.17 inch at Brockton, Mass. The greatest amount in 24 hours was 1.63 inches at Barkhamstead, Conn. on the 22-23d. The average number of days with .01 inch or more of precipitation was 6, which is 5 below the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 131 records, was southwest. The average velocity, based on the records at 14 stations, was 8.6 miles per hour, which is 1.3 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 70 percent of the possible amount, which is 14 percent above the mean.

Cloudiness was considerably below the mean. The average for the Section, based on 134 records, was 15 clear, 9 partly cloudy, and 7 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 12 stations, was 70 percent, which is 6 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Year	Temperature						Precipitation				No. of days (all New England)

Dates of Miscellaneous Phenomena

Auroras.— 14th, 15th, 17th, 22d, 23d, 25th, 29th.

Halos, lunar.— 3d, 12th, 13th, 29th, 30th.

Halos, Solar.—1-3d, 6th, 9th, 10th, 12th, 13th, 15-19th, 21st, 24th, 27th, 29-31st.

Hail.—(dates and general location)— 13th, Oldtown, Me., Fitzwilliam, N.H., Pittsfield, Mass. and Norfolk, Conn.; 14th, Caribou, Me.; 17th, Randolph, N.H. and West Burke, Vt.; 27th, Dry Mills and Gray, Me., Haverhill and Lowell, Mass. and Bristol, Norfolk, Salisbury and Torrington, Conn.; 31st, Portland, Me.

Thunderstorms.— 1st, 4th, 5th, 7-18th, 22d, 27th, 31st.

Fog, dense.— 3-28th.

Frosts.—(dates and general location)—Last heavy to killing frosts of the month recorded: Extreme northern Maine on 23d; elsewhere in northern division and western Massachusetts on 19-21st; elsewhere in southern division on 19th. (Frosts on 19th particularly severe in lowlands; cranberries especially hard hit.)

Sleet.—(dates and general location)— None.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [1] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham: Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for May, 1944

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVI. BOSTON, MASS., JUNE, 1944. No. 6.

GENERAL SUMMARY

June rainfall over New England was mostly above normal, but a few stations in Connecticut and Rhode Island recorded subnormal moisture. The extremely dry weather of May continued into June, and the drought was broken on June 10th, when an inch or more of water fell in nearly all localities, except over extreme northern parts of New Hampshire and Maine. In some localities, it was the wettest June of record; Concord, New Hampshire, Fitchburg, Massachusetts and Hubbardston, Massachusetts reported an excess of ten inches, and there were resulting flash floods in central portions of New Hampshire and Massachusetts. Stream flow at the end of June was high for the Season, except that it was subnormal over the northern half of Maine. Pasturage improved after June 10th. The dry period of some forty-four consecutive days without effective rain, was followed by a typical New England change, as shown by the local torrents of water which fell in the period from the 19th to the 25th.

Warmth was fractionally subnormal over Maine and New Hampshire, and slightly above normal over the other four States, but the Section as a whole averaged exactly normal. Warm and cool periods alternated with some regularity throughout the month. On the 29th, thermometer readings were well up in the 90's, and two stations, in Maine and Massachusetts, reached 100° and 101°. This was the highest June reading in Maine since 1920, and the highest in Massachusetts during the past ten years.

All in all, the weather provided greatly improved conditions for vegetable growth, by restoring soil moisture and supplying needed warmth for germination and growth. Dry weather prevailed from the 26th to the close of the month, and greatly helped haying and further maturing of the hay crop. The potato crop of Aroostook County, Maine, was also substantially helped by the favorable weather.

TEMPERATURE

The average monthly temperature for the Section, based on 109 records, was 64.1°, which is the mean for the past 57 years. The average temperature for the northern division was 62.4°; for the southern division, 65.9°. The highest monthly mean was 70.2° at Springfield, Mass.; the lowest was 54.4° at Eastport, Me. The highest recorded was 101° at Westfield, Mass. on the 29th; the lowest was 23° at Lake Frontiere, Me. on the 4th. The greatest monthly range was 69° at Farmington, Me.; the least was 36° Chatham, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 190 records, was 5.07 inches, which is 1.57 inches above the mean for the past 57 years. The average precipitation for the northern division was 5.06 inches; for the southern division, 5.07 inches. The greatest monthly amount reported was 11.82 inches at Hubbardston, Mass.; the least was 1.19 inches at New Haven, Conn. The greatest amount in 24 hours was 6.16 inches at Greenville, N. H. on the 24-25th. The average number of days with .01 inch or more of precipitation was 13, which is 3 above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 129 records, was southwest. The average velocity, based on the records at 14 stations, was 8.9 miles per hour, which is the mean.

The sunshine, based on the records at 12 stations, averaged 56 percent of the possible amount, which is 3 percent below the mean.

Cloudiness was above the mean. The average for the Section, based on 136 records, was 10 clear, 9 partly cloudy, and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 78 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras.— 4th.

Halos, lunar.— 1st, 2d, 4th, 27th.

Halos, Solar.— 2d, 4th, 8th, 10-12th, 14th, 30th.

Hail.—(dates and general location)— 1st, Bethlehem, N. H., Randolph, N. H.; 7th, Jackman, Me.; 12th, Houlton, Me., Pinkham Notch, N. H.; 16th, Pinkham Notch, N. H., Mays Mill, Vt., Hartford, Conn.; 19th, Searsburg Station, Vt.; 21st, Fort Devens, Mass.; 22d, Arlington, Mass., Boston, Mass.; 29th, East Barnet, Vt.

Thunderstorms.— 1st, 5-7th, 10-13th, 16-27th, 29th.

Fog, dense.— 1-4th, 6-12th, 14-17th, 19-28th.

Frosts.—(dates and general location)— Frosts (or freezing temperatures) on 4th over interior Me. and northern portions of N. H. and Vt. (except Champlain basin); 5th, portions of Middlesex Co., Conn.; 8th, susceptible places in Berkshires.

Earthquake.— Slight shock in Washington and Orange Counties, Vt. on 3d at 9:10 p.m., E.S.T.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters a, b, c, etc. appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for June, 1944

VOL. LVI. BOSTON, MASS., JULY, 1944. NO. 7.

GENERAL SUMMARY

Weather in New England during July, 1944 was typical of the mid-summer season. The temperature averaged generally somewhat above normal, with periods of cool weather from the 2d-5th, 17th-22d and 28-30th. At other times, above normal warmth did not reach extreme readings, and the highest temperature recorded was under the 100° mark, which is more frequently the case than otherwise in July. In the coastal areas of Massachusetts, Rhode Island and Connecticut, the weather was much too dry for favorable growth of crops and vegetation, and, although it was generally too dry for pasturage and hay growth, it was mostly fine haying weather. With more favorable conditions at places more remote from the coast, corn, apples and potatoes were benefited. During the first 9 days of the month, light showers were widely scattered. More copious showers fell from the 10th to the 13th, on the 21st, and from the 25th to the 30th. Totals in Rhode Island and at many stations along the south shore of Massachusetts and Connecticut were less than one inch. Stream flow was slightly above normal in central districts of New England, but was subnormal to the southward and to the northward. Ground water levels fell considerably during the month in central New England, but sampling wells in that area were not subnormal at the close of the month. Hail and lightning did scattered but severe damage on the afternoon of the 4th near North Haven, Conn., with some stones reported as large as lemons. On the 16th, hail and lightning damaged northeastern Massachusetts and the New Hampshire coast, with hailstones the size of golf balls reported at Lynnfield. On the 30th, lightning and wind squalls caused fatalities and other destruction from the vicinity of Boston northward.

TEMPERATURE

The average monthly temperature for the Section, based on 111 records, was 70.2°, which is 1.1° above the mean for the past 57 years. The average temperature for the northern division was 68.2°; for the southern division, 72.2°. The highest monthly mean was 76.0° at Springfield, Mass. and Providence, R. I.; the lowest was 61.0° at Lake Frontiere, Me. The highest recorded was 98° at Orono and Woodland, Me. on the 9th; the lowest was 31° at Lake Frontiere, Me. on the 19th. The greatest monthly range was 61° at Fort Kent, Me; the least was 28° at Chatham, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 3.04 inches, which is 0.71 inch below the mean for the past 57 years. The average precipitation for the northern division was 3.67 inches; for the southern division, 2.39 inches. The greatest monthly amount reported was 9.93 inches at Turners Falls, Mass.; the least was 0.33 inch at Shelton, Conn. The greatest amount in 24 hours was 4.61 inches at Turners Falls, Mass. on the 16th. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was southwest. The average velocity, based on the records at 14 stations, was 7.6 miles per hour, which is 0.6 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 67 percent of the possible amount, which is 6 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 136 records, was 14 clear, 10 partly cloudy and 7 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 77 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

NOTE: Observations taken at 7:30 a. m. E. S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for July, 1944

VOL. LVI. BOSTON, MASS., AUGUST, 1944. No. 8.

GENERAL SUMMARY

Weather in New England was outstandingly hot during the first 17 days of August, 1944, except for a few brief periods in the first 10 days. From the 11th through the 17th, the heat averaged from 10° to 20° above normal, daily, and the extremes reached above 100° in each of the 6 States. This period was, perhaps, the longest of record of sustained severe heat in New England. In many localities, it was the first time on record that a temperature of 100° or higher occurred in August. The extreme maxima were generally recorded on the 11th and 12th. During this period of record-breaking heat, there was an exceedingly serious lack of rain, except in a few localities and the result was great injury to garden crops, grass, pasturage, and "Victory Gardens." Hay harvesting weather was almost wholly satisfactory, but a second hay crop generally failed. The drought and heat wave were broken in the afternoon and evening of the 17th, with the occurrence of severe and widespread thundershowers, and there was no further difficulty during the month from excess heat. The lack of rain, however, persisted over Rhode Island, the southern half of Connecticut and southeastern Massachusetts, so that stock water and private domestic supplies failed completely in several instances. In many localities, stream flow and ground water observation wells were seriously deficient. Orchard crops and cranberries were substantially hurt by the drought and heat, while potatoes and tobacco about held their own or gained slightly. A rather seriously damaging hailstorm occurred in the tobacco growing areas of the Connecticut Valley on the 5th. On the whole, the month's weather was definitely detrimental to agriculture, while greatly favoring outdoor activities.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 70.5°, which is 3.4° above the mean for the past 57 years. The average temperature for the northern division was 69.2°; for the southern division, 71.9°. The highest monthly mean was 75.6° at Providence, R. I.; the lowest was 61.6° at Somerset, Vt. The highest recorded was 103° at Norwalk, Conn. on the 11th; the lowest was 30° at Lake Frontiere, Me. on the 27th. The greatest monthly range was 60° at 11 stations in the northern division and Massachusetts; the least was 29° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 190 records, was 1.79 inches, which is 1.96 inches below the mean for the past 57 years. The average precipitation for the northern division was 1.80 inches; for the southern division, 1.78 inches. The greatest monthly amount reported was 5.14 inches at Burlington, Conn.; the least was 0.29 inch at New Castle, N. H. The greatest amount in 24 hours was 3.25 inches at Clinton, Mass. on the 17-18th. The average number of days with .01 inch or more of precipitation was 7, which is 3 below the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was southwest. The average velocity, based on the records at 13 stations, was 7.9 miles per hour, which is 0.1 mile per hour above the mean.

The sunshine, based on the records at 12 stations, averaged 72 percent of the possible amount, which is 12 percent above the mean.

Cloudiness was considerably below the mean. The average for the Section, based on 135 records, was 16 clear, 10 partly cloudy and 5 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 12 stations, was 74 percent, which is 7 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for August, 1944

VOL. LVI. BOSTON, MASS., SEPTEMBER, 1944. No. 9.

GENERAL SUMMARY

The severe drought conditions which prevailed generally throughout nearly all of New England during August, were greatly relieved by rains the first few days of September. A marked absence of rain for three to four days preceded the hurricane rains of the 12-15th. These rains restored water supplies to somewhat above normal in storage reservoirs, although accumulated precipitation for the year, thus far continues somewhat deficient in many districts. The first killing frosts of the season occurred in nearly all localities remote from the coast on the 24th and 25th.

HURRICANE—SEPTEMBER 1944.

On September 4th, a tropical disturbance was discovered over the ocean some 5° longitude to the east-southeastward of Trinidad. In a general way, it moved northwestward, and on Sunday morning September 10th was observed some 300 odd miles to the north-northeastward of Puerto Rico, and moving northwesterly.

On Monday morning, the 11th, the center was reported roughly near latitude 25°N and longitude 69°W. On Wednesday morning, the 13th, the center has moved to a position about 400 miles east of Vero Beach, Florida, and was shaping a course toward the coasts of the Carolinas. On Thursday, the 14th, the storm center at 4:00 a.m. was about 100 miles south of Beaufort, North Carolina and was of savagely destructive intensity. At 7:30 a.m., the center was very close to and slightly inland of Cape Hatteras. During this forenoon, while we were reading air-mail that a tropical hurricane had safely passed Puerto Rico the preceding Sunday, the storm center moved at 1:30 p.m. to about 40 miles to the northeastward of Cape Charles. Continuing northeastward, the center was about 30 miles to the southward of the mid-portion of the Long Island shore at 7:30 p.m.

During all this time all the organized forces of the Weather Bureau, the Army and Navy, were at work spreading the alarm well in advance of the advancing storm. The cooperation of all private communications interests was superb, and warning of the destructive character of the hurricane were adequately distributed into all communities.

(Continued on page 68)

TEMPERATURE

The average monthly temperature for the Section, based on 110 records, was 61.3°, which is 1.1° above the mean for the past 57 years. The average temperature for the northern division was 59.3°; for the southern division, 63.6°. The highest monthly mean was 67.1° at New Bedford, Mass.; the lowest was 54.0° at Lake Frontiere, Me. The highest recorded was 93° at Brockton and Weston, Mass. and Norwalk, Conn. on the 2d; the lowest was 20° at Lake Frontiere, Me. on the 24th and 27th. The greatest monthly range was 65° at Weston, Mass.; the least was 33° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 6.16 inches, which is 2.36 inches above the mean for the past 57 years. The average precipitation for the northern division was 5.60 inches; for the southern division, 6.72 inches. The greatest monthly amount reported was 12.38 inches at Bridgeport, Conn.; the least was 2.67 inches at Nantucket, Mass. The greatest amount in 24 hours was 5.80 inches at Bridgeport, Conn. on the 14-15th. The average number of days with .01 inch or more of precipitation was 11, which is 2 above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 126 records, was northwest. The average velocity, based on the records at 14 stations, was 7.9 miles per hour, which is 0.8 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 54 percent of the possible amount, which is 3 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 138 records, was 10 clear, 8 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 83 percent, which is 2 percent above the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.**)

Dates of Miscellaneous Phenomena

Auroras.— 20th, 22-24th.

Halos, lunar.— 30th.

Halos, Solar.— 4th, 8th, 12th, 19th, 24-27th.

Hail.—(dates and general location)— 1st, Madison, Me.; 2d, Searsburg Mountain, Vt. and Windsor Locks, Conn.; 21st, Berlin, N. H.; 22d, Woodstock, N. H.

Thunderstorms.— 1-5th, 7th, 13-16th, 21st, 22d, 28th.

Fog, dense.— 1-21st, 23-30th.

Frosts.—(dates and general location)— First killing frost of season on 24th over most of northern division (except along immediate coast), in the Berkshires and in susceptible places of southern division (except along immediate coast and Cape Cod); 25th, killing frosts in lowlands of Rhode Island and some adjoining portions of Massachusetts and Connecticut not affected on 24th; light to heavy frost in most other areas on 24th, 25th.

Earthquake.— Occurrence of slight intensity over entire Section on 4th at about 11:40 p.m., E.S.T. (or on 5th at 12:40 a.m., E.W.T.); duration from 15 to 30 seconds; no damage reported in New England; (epicenter of quake in vicinity of Cornwall, Ontario).

NOTE: Observations taken at 7:30 a. m. E S.T.

[Continued from page 65]

From Long Island, the storm center passed inland between Charlestown, Rhode Island and Point Judith at 10:20 p.m., Eastern Standard Time of the 14th, and moved in approximately a straight course, passing between Fall River and Providence, nearly over Brockton, and over the S. Weymouth Navy Hangar at 6 minutes past to 10 minutes past midnight a.m. of the 15th, E.S.T. The journey of the center was approximately 67 miles from Point Judith to S. Weymouth in 1 hour and 50 minutes, or about 36-37 miles per hour, over the land. With the center at S. Weymouth, the wind shifted at 12:05 to 12:06 a.m. from southeast, (135°) to west (270°) with wind under 4 miles per hour for 3 minutes, and less than 10 miles per hour for 25 minutes. The diameter of the center having a wind movement of under 10 miles per hour, was, therefore, about 15 miles. The center then passed out to sea, over Massachusetts Bay, moving very near the tip of Cape Ann, then across the Gulf of Maine, and again entered over the continent near Bar Harbor, Maine. Passing between Eastport and Calais, Maine, the center entered over the Province of New Brunswick at about 8:00 a.m, E.S.T. of the 15th, continuing over Prince Edward Island at 12:30 noon, E.S.T. of the 15th, thence over the Gulf of St. Lawrence, the middle of Newfoundland, and out to sea over the Atlantic.

[Continued on page 69]

[Continued from page 68]

The storm track thus approximated a regular curve of relativly definite spherical ordinates, except near its origin.

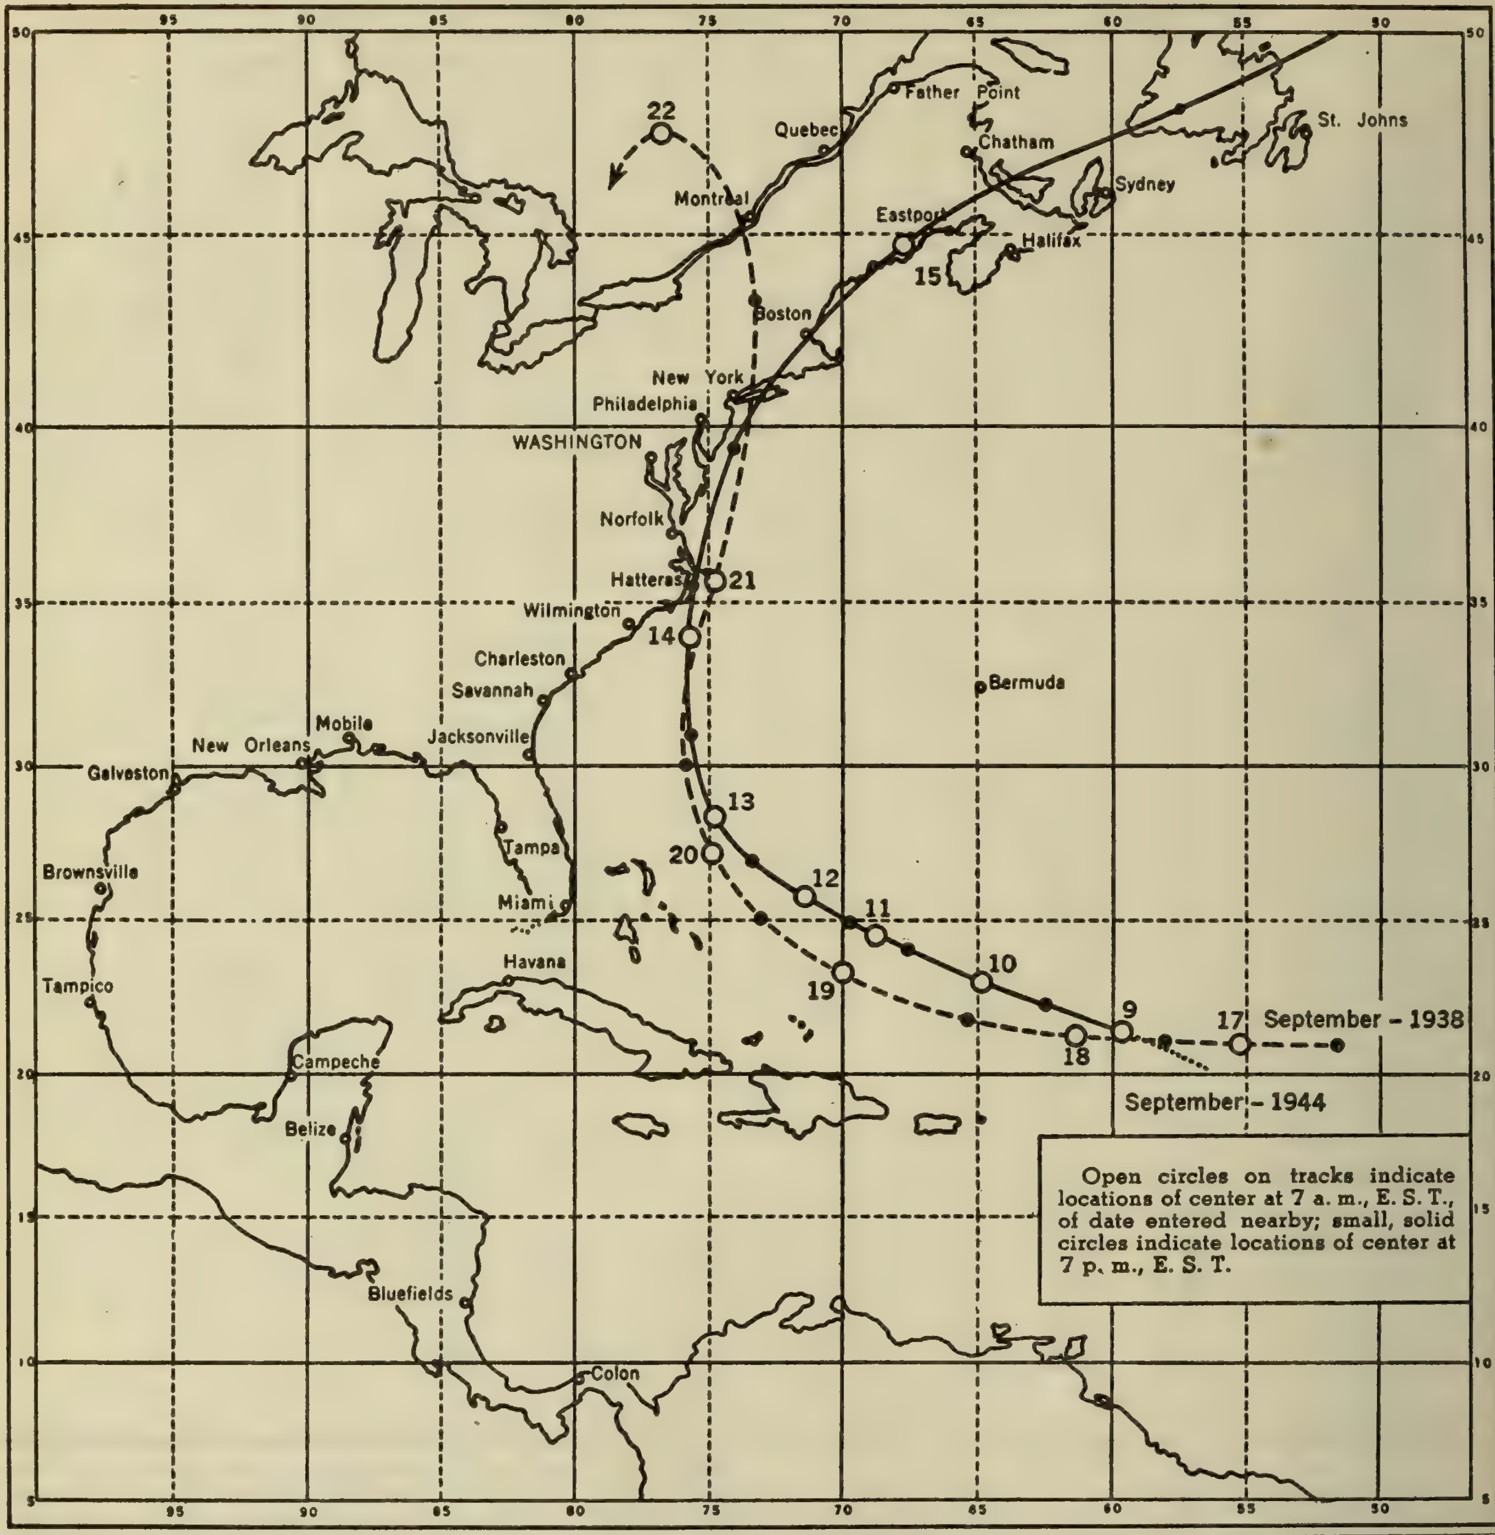
The appended table, shows various statistics of time, pressure, and winds of the storm, and indicates the rapid filling of the center during its landward course, and as cooler air flowed in from the northwest. This time-table shows that the center moved the entire course from S. Weymouth to Eastport in about 7 hours and a half, a distance of almost 220 miles, or slightly less than 30 miles per hour.

The damaging effects of the storm were of moderate severity some 50 miles to the northwestward of the center track, over southern New England, but were appreciably less over the east Maine coast. Over the region to the southeast of the center track, the damage was extreme and in some cases, tragic. In New England alone, there were some 40 deaths from the storm. The lightvessel "Vineyard" dragged from her station and sank about two miles to the northwestward. Some 4000 houses were seriously damaged or destroyed. 600 smaller structures were destroyed, and over 5000 smaller building required critical renovation as a result of hurricane winds. The time of high tide not coinciding with the rolling-up of the storm tide averted an immense amount of destruction. In dollars, the damages were in the scores of millions.

Had there been no warnings from the Weather Bureau and from other Government Agencies, the list of fatalities would have been in the hundreds, and replacement structural damage in the

[Continued on page 70]

TRACKS OF THE DESTRUCTIVE SEPTEMBER HURRICANES OF 1938 AND 1944



Open circles on tracks indicate locations of center at 7 a. m., E. S. T., of date entered nearby; small, solid circles indicate locations of center at 7 p. m., E. S. T.

[Continued from page 69]

hundreds of millions.

The southeast quadrant of the storm embraced the southeastern parts of Plymouth and Bristol Counties and western Barnstable County. It was in these areas where the greatest damage was wrought by the tempest. There were evidences of one or more small tornadoes in the turmoil of the air stream. Some groves of trees were leveled off, by breaking and some by uprooting; while little tree damage was occurring nearby. Evidences of tornadic discontinuities in air pressure were recorded on the barograms starting at 2100 E.S.T. at Sandy Hook and La Guardia, at 2300 to 2330 at New Haven, Fishers Island, and Point Judith, at 0010 to 0030 at Hartford, Chicopee and Blue Hill, at 0100 to 0130 at Nantucket and Boston, and at 0200 to 0230 at Rockport and Cape Cod Light. This list does not preclude the probabilities of other occurrences. The rain accompanying the storm averaged approximately 6 inches for the portions of the 4 days, 12th to 15th, from Sandy Hook to Portland. The least amounts of rain, scarcely 2 inches, fell at Block Island, Nantucket and outer Cape Cod. Nature's miracle of weather of greatest beauty and delight followed within a few hours the passage of the storm center.

VOL. LVI. BOSTON, MASS., OCTOBER, 1944. No. 10.

GENERAL SUMMARY

Weather in New England during October, 1944, was more than ordinarily favorable, due, mostly, to less than usual frequency of rainy weather, and to an extended period of mild, pleasant conditions from the 6th through the 13th. Much of the month's total precipitation occurred on the 20th-21st, attendant upon the storm of tropical origin whose center passed at sea close to Nantucket during the 21st. This was the same storm which had previously damaged parts of Florida and other areas of the South Atlantic States. The lowest pressure of the month along the southern New England coast was of general occurrence during this storm, except that another serious storm menaced the coast off Nantucket early on the 28th, with attendant lowest pressure of 29.37 inches at that point, and 29.30 inches at Eastport, Me. on the following day. Elsewhere in the Section, lowest monthly pressure occurred generally on the 14th. Precipitation was deficient over the three southern States and extreme southern portions of the northern division, and was above normal elsewhere in the northern division, with greatest monthly totals over eastern Maine. Due to September's excess precipitation, ground water supplies, lakes, streams and reservoirs were up to seasonal normals or somewhat above in all sections. The first measurable snowfall of the season occurred at some of the higher elevations of the northern division on the 15th, while measurable snowfall in light amount was recorded at many stations in northern New England after the 20th. Harvesting was generally favored, and New England was producing a normal share of the potatoes of the Country. Results of early season weather which had so ravaged the cranberries of Massachusetts were shown in final harvests, with production less than 40% of the normal crop. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 110 records, was 48.5°, which is 1.0° below the mean for the past 57 years. The average temperature for the northern division was 46.1°; for the southern division, 51.1°. The highest monthly mean was 55.4° at New Bedford, Mass.; the lowest was 40.6° at Lake Frontiere, Me. The highest recorded was 88° at Weston, Mass. on the 7th; the lowest was 9° at Fort Kent, Me. on the 31st. The greatest monthly range was 68° at Weston, Mass.; the least was 32° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 2.88 inches, which is 0.63 inch below the mean for the past 57 years. The average precipitation for the northern division was 3.54 inches; for the southern division, 2.21 inches. The greatest monthly amount reported was 7.65 inches at Ft. Fairfield, Me.; the least was 1.29 inches at Hillsboro, N. H. The greatest amount in 24 hours was 3.71 inches at Beechwood, Mass. on the 20th-21st. The average number of days with .01 inch or more of precipitation was 8, which is 1 below the mean for the past 57 years.

The average snowfall for the northern division, based on 95 records, was 0.5 inch; for the southern division, based on 96 records, 0.0 inch; for the Section, based on 191 records, 0.2 inch, which is the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 128 records, was northwest. The average velocity, based on the records at 14 stations, was 9.3 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 56 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 133 records, was 13 clear, 8 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 78 percent, which is 1 percent below the mean.

Dates of Miscellaneous Phenomena

Auroras.— 10th, 14-17th.

Halos, lunar.— 23d.

Halos, Solar.— 2-4th, 7th, 12th, 20th, 24th, 25th.

Hail.—(dates and general location)— 7th, Lewiston, Me., Fitzwilliam, Lakeport (1 inch diameter) and Plymouth, N. H., Somerset, Vt. and Stockbridge, Mass.; 8th, Oldtown, Me.

Thunderstorms.— 7-10th, 14th, 25th, 26th.

Fog, dense.—1st, 2d, 4-14th, 17th, 18th, 20th 21st, 23-26th.

FROSTS.—(dates and general location of first killing frost in areas not affected during September)—On 3d, in Champlain Valley and some hilltop areas of southern New Hampshire; 4th, 16th, immediate coast areas and less susceptible places of southern New England; 23d, 31st, sheltered areas of southern New England coast. No killing frost yet recorded in Barnstable County or in islands off the south coast.

SLEET.—(dates and general location)— 15th, Eastport, Millinocket, and Orono, Me., Alexandria, Berlin, and Plymouth, N. H., and Hoosac Tunnel, Mass.; 17th, Brassua Dam, Me.; 21st, Milo, Me., and Pinkham Notch and Randolph, N. H.; 27th, Blue Hill, Mass., and New Haven, Conn.; 28th, Bangor, Me., Boston and New Bedford, Mass.

NOTE: Observations taken at 7:30 a. m. E S. T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for October, 1944

NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVI. BOSTON, MASS., NOVEMBER 1944. No. 11.

GENERAL SUMMARY

Warmth, moderately in excess of normal, prevailed over New England during the first 5 days and last 5 days of the month, and on the 10th and 11th. In the absence of any severe or extended period of cold weather, the month for the Section as a whole, averaged slightly warmer than normal, with near-normal temperature in the southern division, and somewhat above in the northern division. Greatest excess of warmth was recorded in northeastern Maine (+6.5° at Caribou). Snow did not differ importantly from usual November averages, but rain was widely in excess in southern and eastern sections, due largely to the heavy storm of the 29-30th. Water storage and power supplies were satisfactorily above normal. A storm of serious force moved from the South Carolina coast on the 20th to the New Jersey coast on the 21st, and was re-energized by another center moving from the lower Lakes to the south-southeastward of Nantucket on the 22d. As it moved some distance south of and parallel to the southern New England coast, attended by strong winds and gales, much flooding resulted, particularly along Long Island Sound, as the northeast storm wave combined with the lunar tide. This storm was slightly similar to the tragic storm of November, 1898, in the junction of forces of two centers near the New Jersey coast; fortunately the energy released was less in the present occurrence. Another disturbance advanced from the Gulf and eastern Louisiana on the 29th, and at 8:30 a.m., E.W.T., of the 30th, was centered in mid-Long Island Sound, about half-way between New Haven and the mouth of the Connecticut River; at 3:30 p.m., the center was near Concord, N. H.; and at 8:30 p.m., it was about 50 miles to the southwestward of Lac Frontiere in Quebec. Lowest pressure reported during the storm's passage was 28.82 inches at Concord, N.H. This storm produced much of the excess of monthly precipitation over the areas under its influence, and the attendant wind force was slightly greater than that of the storm of the 21-22d.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 38.4°, which is 0.4° above the mean for the past 57 years. The average temperature for the northern division was 36.1°; for the southern division, 40.9°. The highest monthly mean was 45.8° at New Bedford, Mass.; the lowest was 31.4° at Lake Frontiere, Me. The highest recorded was 74° at Fitchburg, Mass. on the 3d; the lowest was 5° at Somerset, Vt. on the 24th. The greatest monthly range was 62° at Dorset, Vt.; the least was 31° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 4.84 inches, which is 1.31 inches above the mean for the past 57 years. The average precipitation for the northern division was 3.47 inches; for the southern division, 6.20 inches. The greatest monthly amount reported was 11.28 inches at Wood River Junction, R. I.; the least was 1.11 inches at Waterbury (near), Vt. The greatest amount in 24 hours was 3.22 inches at New Hartford, Conn. on the 16-17th. The average number of days with .01 inch or more of precipitation was 11, which is 1 above the mean for the past 57 years.

The average snowfall for the northern division, based on 89 records, was 9.7 inches; for the southern division, based on 79 records, 3.2 inches; for the Section, based on 168 records, 6.6 inches, which is 1.8 inches above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was northwest. The average velocity, based on the records at 14 stations, was 10.7 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 40 percent of the possible amount, which is 4 percent below the mean.

Cloudiness was considerably above the mean. The average for the Section, based on 141 records, was 8 clear, 6 partly cloudy and 16 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 83 percent, which is 7 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters ᵃ,ᵇ,ᶜ, etc. appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for November 1944

VOL. LVI. BOSTON, MASS., DECEMBER 1944. No. 12.

GENERAL SUMMARY

For the third consecutive December, the temperature in New England during this month of 1944 averaged well below normal. Three extended periods of cold weather accounted for the temperature deficiency: 1-4th, 18-23d, 27-30th. Dates of monthly minima were the 19th, 20th, 22d and 30th. Mild weather from the 5th through the 12th was more than ordinarily favorable for out-door activities, pre-winter chores, and cutting fuel wood and Christmas trees. Warm rains on the 8-9th removed much of a moderate snow cover over interior districts, except the more remote districts of northern counties. On the 19th, a moderate to heavy snowstorm occurred over the southern division, providing a snow cover which extended to the south shore, and, slowly diminishing, remained to the close of the month. While total precipitation for the month was generally slightly subnormal, the volume of snow was in excess of normal by approximately 40 percent. At the close of the month, the snow cover ranged, in depth, from nearly 26 inches in the high elevations of the northern division to about an inch or less along the south shore. On the 12th, a storm of considerable intensity passed over New England, attended by gales of more than 50 miles per hour, and with lowest monthly barometric pressure, below 28.90 inches. Toward the end of the month, typical mid-winter slowing of outside pursuits was becoming more pronounced; ice harvest had not yet started. On the whole, the weather during this month was slightly more severe than that usually experienced in New England in December. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 117 records, was 23.8°, which is 2.6° below the mean for the past 57 years. The average temperature for the northern division was 19.8°; for the southern division, 27.9°. The highest monthly mean was 35.2° at Nantucket, Mass.; the lowest was 11.9° at Lake Frontiere, Me. The highest recorded was 55° at Nantucket, Mass. on the 12th; the lowest was −36° at Lake Frontiere, Me. on the 19th. The greatest monthly range was 77° at Lake Frontiere, Me.; the least was 39° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 3.14 inches, which is 0.17 inch below the mean for the past 57 years. The average precipitation for the northern division was 2.96 inches; for the southern division, 3.31 inches. The greatest monthly amount reported was 6.01 inches at Machias, Me.; the least was 1.02 inches at Bethlehem, N. H. The greatest amount in 24 hours was 1.82 inches at Moosehead, Me. on the 30 (Nov.) - 1st (Dec.). The average number of days with .01 inch or more of precipitation was 10, which is the mean for the past 57 years.

The average snowfall for the northern division, based on 91 records, was 19.1 inches; for the southern division, based on 81 records, 10.6 inches; for the Section, based on 172 records, 15.1 inches, which is 4.1 inches above the mean for the past 57 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 134 records, was northwest. The average velocity, based on the records at 14 stations, was 10.4 miles per hour, which is 0.5 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 53 percent of the possible amount, which is 9 percent above the mean.

Cloudiness was near the mean. The average for the Section. based on 147 records, was 11 clear, 8 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut,)

Dates of Miscellaneous Phenomena

Auroras.— 14th, 18th, 19th.

Halos, lunar.— 1st, 2d, 8th, 21-24th, 27th, 29th, 30th.

Halos, Solar.— 1st, 6th, 11th, 14th, 17-22d, 27-29th.

Hail.—(dates and general location)— None.

Thunderstorms.— None.

Fog, dense.—7-9th, 12th, 22-26th, 31st.

Sleet. — (State, date and number of stations reporting) — Maine: 12th, 12; 25th, 3; 28th, 1. — New Hampshire: 12th, 9; 23d, 1; 25th, 8; 31st, 4. — Vermont: 12th, 3; 25th, 4; 27th, 1; 31st, 1. — Massachusetts: 11th, 2; 12th, 9; 23d, 2; 25th, 6; 27th, 2; 28th, 4; 31st, 7. — Rhode Island: 12th, 1. — Connecticut: 11th, 3; 12th, 4; 25th, 9; 26th, 1; 27th, 6; 28th, 5; 31st, 3.

Earthquake. — On 13th, at about 10:15 p. m. EST, in portions of Rhode Island and Connecticut; of slight intensity, no damage reported.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries   ††† Observer for New England Power Co.   T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement.   ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.   ‡ Precipitation measured with recording gage.   ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs.   § Also on other dates.

Daily Precipitation for December 1944
